Lab Rotations

Responsible for the Module Prof. Dr. Markus Kollmann			**Date** 01.11.2019
Lecturer(s) All group leaders offering Lab Rotations			
Language: English			**Modus** Obligatory Course
Work Load 300 h	**Credits** 10 CP	**Contact Time** 60 h	**Self-study** 240 h
Course Practical Work	**Turnus** –	**Group Size** –	**Duration** 6 Weeks

Learning results & Competences

Students can work independently on a specific Data Science / AI project within a larger research group. They understand how the data they work on have been generated and preprocessed. They understand the goals of the research project and how the data analysis is connected to it. They are able to identify suitable algorithms to analyse the data and know their limitations. They can benchmark algorithms against each other and can carry out statistical analysis of their performance. They are able to present the results of their work to an audience that has different scientific background.

Content

The co-supervisors agree on a lab rotation project based on the tasks to be carried out. The project can involve all steps of a data analysis pipeline – e.g. data cleaning, data preprocessing, data analysis, data postprocessing, data visualization – but not data generation. Ideally, these tasks should be realized by self-written code. Special emphasis in a lab rotation should be given to sensitise students for the peculiarities of the involved data and that students give understandable presentations of their results.

Teaching

Students can apply to research groups that generate/analyse data to carry out a lab rotation. The group leaders offering lab rotation places may choose among applicants according to their suitability. Lab rotations can also be carried out outside the university in R&D environments that generate/analyse sufficiently large data sets. The lab rotation requires permanent physical presence of the student within the chosen research group. The student is co-supervised by a member of the chosen research group and a lecturer that is involved in a theoretical module in the Master's Program „Artificial Intelligence and Data Science".

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science".
Contentual: none

Examination

None.

Prerequisites for receiving credit points

Permanent presence in the chosen research/development group

Active participation at research/development work

Giving a seminar talk

Study Program

M.Sc. Artificial Intelligence and Data Science

Module accessible for other Study Programs

No

Weight in overall rating

None

Further Information

Master Thesis

Responsible for the Module Prof. Dr. Markus Kollmann			**Date** 01.11.2019
Lecturer(s) All group leaders offering projects for Master Thesis			
Language: English			**Modus** Obligatory Course
Work Load 900 h	**Credits** 30 CP	**Contact Time** 60 h	**Self-study** 840 h
Course Practical Work	**Turnus** –	**Group Size** –	**Duration** 6 Months

Learning results & Competences

With the written thesis, the students prove that they are able to carry out scientific work independently on a topic in the field of Artificial Intelligence and Data Science within a given period of time (6 months). They are able to develop their findings concisely and to evaluate or interpret them competently. The Master's thesis must be written in English and presented in an oral presentation.

Content

The content of the master thesis is defined by the supervisor.

Teaching

Students can apply to any research group that offers data science projects for a Master Thesis. Ideally, the thesis should be carried out in one of the two groups where a Lab Rotations has been completed. If the Master Thesis is carried out outside the computer science department the student is co-supervised by a member of the chosen research group and a lecturer that is involved in a theoretical module in the Master Program „Artificial Intelligence and Data Science“.

Prerequisites for attending

Formal: Starting a Master Thesis requires at least 60CP of passed courses within the program „Artificial Intelligence and Data Science“.
Contentual: none

Examination

Grading of the content of Master Thesis and its oral presentation

Prerequisites for receiving credit points

(1) Successful work on the topic and on-time submission of the thesis
(2) Giving an oral presentation of the content of the thesis

Study Program

M.Sc. Artificial Intelligence and Data Science

Module accessible for other Study Programs

Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points.
Further Information

Advanced Programming and Algorithms

Responsible for the Module Dr. Anja Rey			**Date** 16.08.2022
Lecturer(s) Dr. Anja Rey			
Language: English			**Modus** Obligatory Course
Work Load 300 h	**Credits** 10 CP	**Contact Time** 120 h	**Self-study** 180 h
Course Lecture: 4 SWS Exercises: 4 SWS	**Turnus** Each Winter Term	**Group Size** Limited to 40	**Duration** 2 Semesters

Learning results & Competences

After completing the first part the students can
- reproduce algorithmic and programming principles, and explain technical terms and basic methods,
- describe known algorithms and new algorithms based on pseudocode and Python code and apply them exemplarily to adequate problem settings,
- implement algorithms in Python and apply selected software engineering tools,
- distinguish between data structures (theoretically and in Python) and apply them in adequate contexts,
- interpret and visualise different types of data,
- analyse algorithms (e.g., compute and classify their running time) and prove their correctness,
- test their code and apply test driven development,
- evaluate code and apply refactoring techniques in order to improve code quality,
- operate a version control system and develop in groups,
- evaluate the quality of a given piece of code and provide reviews for improvement,
- create reproducible environments and build data science workflows, and
- design and develop algorithms based on known methods.

After completing the second part the students can:
- reproduce further algorithms, programming principles, and data structures,
- implement further algorithms in Python and apply selected software engineering tools,
- match algorithms to different algorithmic design paradigms and apply them exemplarily,
- adapt algorithms and data structures and transfer them to new contexts,
- design algorithms according to adequate design paradigms,
- classify and evaluate algorithms according to further analysis techniques, and
- classify algorithmic problems according to basic complexity classes.

Content

This course consists of two parts about algorithm design and programming. It provides an insight into algorithmic and programming tools, combining theoretical and practical methods

that build a foundation for further courses in the Master of Articficial Intelligence and Data Science programme.
Winter term:
- Algorithmic foundations and data structures
- Introduction to the Python programming language
- Algorithm analysis (running time analysis, correctness proofs)
- Software engineering methods for code quality (software testing, code review, refactoring)
- Version control systems (e.g., git) and continuous integration
- Classic algorithms (e.g., sorting algorithms, graph algorithms) and data streams
- Selected packages (e.g., numpy, matplotlib, pandas)
- Data science workflows (e.g. snakemake), reproducible environments (e.g. docker)
Summer term:
- Algorithmic design principles (recursion, divide-and-conquer, dynamic programming, greedy algorithms) and their analysis
- Further application of Python programming and software development methods
- Further algorithms (e.g., sorting, search, graph algorithms, pattern matching)
- Further data structures (e.g., search trees, splay trees, B-trees, suffix trees, heaps, hashing)
- Object oriented programming
- Computational complexity (e.g., P vs. NP, NP-completeness)

Teaching
Lecture with (theoretical and practical) exercises

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: none

Examination
Written examination after both courses about content of lectures and exercises

Prerequisites for receiving credit points
(1) Regular and active participation in the exercises
(2) Passing the examination

Study Program
M.Sc. Artificial Intelligence and Data Science

Module accessible for other Study Programs

Weight in overall rating
The mark given will contribute to the final grade in proper relation to its credit points

Further Information

Deep Learning

Responsible for the Module Prof. Dr. Paul Swoboda			**Date** 21.02.2025
Lecturer(s) Prof. Dr. Paul Swoboda, Jun.-Prof. Kira Maag			
Language: English			**Modus** Obligatory Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Each Winter Term	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After successfully finishing the course, the student

* can understand and can explain the theoretical foundations of deep learning
* can implement and apply algorithms of deep learning

Content

This module teaches foundational knowledge about:

* Loss functions and optimization
* Neural networks / backpropagation
* Deep learning software
* Convolutional neural networks
* Generative models
* Recurrent neural networks

Teaching

Lecture with theoretical and practical exercises

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.

Machine Learning

Responsible for the Module Prof. Dr. Paul Swoboda			**Date** 21.10.2025
Lecturer(s) Prof. Dr. Paul Swoboda			
Language: English			**Modus** Obligatory Course
Work Load 300 h	**Credits** 10 CP	**Contact Time** 100 h	**Self-study** 200 h
Course Lecture: 4 SWS Exercises: 2 SWS	**Turnus** Each Winter Term	**Group Size** Limited to 50	**Duration** 1 Semester

Learning results & Competences

After successfully finishing the course, the student

* can understand and can explain the theoretical foundations of machine learning.
* can explain the foundations in mathematical terms and can do proofs about it
* can implement and apply algorithms of machine learning

Content

This module teaches foundational knowledge about the following topics:

* Probability, frequentist statistics, Bayesian statistics
* Supervised learning, unsupervised learning
* Generative vs discriminative models
* Linear regression, linear discriminant analysis
* Gaussian processes
* Support vector machines
* Kernel trick, kernel PCA
* Boosting, decision trees

Teaching

Mathematical and Statistical Foundations of Data Science

Responsible for the Module Dr. Peter Arndt			**Date** 28.03.2025
Lecturer(s) Dr. Peter Arndt, Dr. Konrad Völkel			
Language: English			**Modus** Obligatory Course
Work Load 300 h	**Credits** 10 CP	**Contact Time** 90 h	**Self-study** 210 h
Course Lecture: 4 SWS Exercises: 2 SWS	**Turnus** Each Winter Term	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences

Students know the basic concepts of linear algebra, convex optimization, Bayesian statistics, Markov chains and information theory. They can carry out fundamental algorithms, prove simple facts from these fields, and explain details of a given proof. They can connect common Python libraries to their mathematical background.

Content

Lecture:

Linear Algebra. Eigenvalue problems, Singular value decomposition, Low rank approximation, matrix differential calculus.

Probability: Foundations, conditional expectation, central limit theorem

Statistics: Maximum likelihood and maximum a posteriori estimation, a posteriori distributions, conjugate priors, exponential families, generalized linear models.

Stochastic Processes: Markov chains, Hidden Markov models

Convex Optimisation. Primal and dual problem, Lagrangian, duality gap, KKT conditions, regularization.

Monte Carlo methods: importance sampling rejection sampling, Markov Chain Monte Carlo, Metropolis Hastings, Gibbs sampling.

Information Theory: Entropy and coding, KL-divergence, differential entropy.

Exercises:

The content of the lecture is applied and deepened in theoretical exercises. In addition, the students will apply the methods using Python.

Teaching

Lecture with (theoretical and practical) exercises

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.

Contentual: none

Examination

written examination
Prerequisites for receiving credit points Regular and active participation in the exercises Passing the examination
Study Program M.Sc. Artificial Intelligence and Data Science

Further Information

Advanced Topics in Bayesian Data Science

Responsible for the Module Prof. Dr. Martin Lercher, Dr. Pablo Verde			**Date** 08.10.2026
Lecturer(s) Dr. Pablo Verde			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 50 h	**Self-study** 100 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Each Winter Term	**Group Size** Limited to 40	**Duration** Block Course, 2 Weeks

Learning results & Competences

The course teaches the role of computer simulations and Bayesian methods for real modelling. Students that completed this module have a profound knowledge in using R and WinBUGS for Bayesian modelling.

Content

Introduction to Bayesian hierarchical (linear and generalized) models, Bayesian inference and empirical Bayesian inference, Monte-Carlo techniques and MCMC-computations, Bayesian meta-analysis, in particular for diagnostic test data. Evidence synthesis for deterministic models. Explorative data analysis of multi-step and logitudinal data. Bayesian models for statistical regression problems. Linear regression with a large number of covariates. Variable selection. Explorative multivariate analysis. A-priori distributions for variance-covariance-matrices. Bayesian treatment of missing (random and non-random) variables. Survival modelling. Bayesian nonparametric models, mixed models. Statistical modelling with Dirichlet-process mixtures.

Teaching

Lecture with theoretical and practical exercises

Advanced Deep Learning

Responsible for the Module Prof. Dr. Paul Swoboda			**Date** 08.10.2026
Lecturer(s) Prof. Dr. Paul Swoboda			
Language: English			**Modus** Elective Course
Work Load 300 h	**Credits** 10 CP	**Contact Time** 90 h	**Self-study** 210 h
Course Lecture: 4 HPW Exercises: 2 HPW	**Turnus** Irregular	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences
The students will obtain deep understanding of Deep Learning techniques and applications. The focus will lie on in-depth understanding and, wherever possible, reimplementation of a wide range of important techniques.

Content
Modern Deep Learning Architectures.
Learning paradigms, supervised and self-supervised.
Algorithmic advances in deep learning.
Transformer and state space architectures and their training.

Teaching
Lecture with theoretical and practical exercises

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Machine Learning, Deep Learning

Examination
written or oral examination

Prerequisites for receiving credit points
Regular and active participation in the exercises
Passing the examination

Algorithmic Game Theory

Responsible for the Module			Date
Prof. Dr. Jörg Rothe			14.10.2025
Lecturer(s)			
Prof. Dr. Jörg Rothe			
Language:			**Modus**
English			Elective Course
Work Load	**Credits**	**Contact Time**	**Self-study**
300 h	10 CP	100 h	200 h
Course	**Turnus**	**Group Size**	**Duration**
Lecture: 4 SWS Exercises: 2 SWS	Irregular	–	1 Semester

Learning results & Competences

The goal of this module is to introduce into the most important topics, results, models, and methods of algorithmic game theory, which is a central theoretical foundation of numerous applications in artificial intelligence and multiagent systems. The students will get to know central game-theoretic problems and algorithms solving them; they will be able to modify and apply these algorithms; they learn how to describe strategic scenarios by cooperative or noncooperative games, and to formally characterize concepts of stability and equilibria in these games. They will also be able to analyse the corresponding decision and optimization problems (in suitable compact representations) in terms of their computational complexity.

Content

Noncooperative Game Theory:
– Foundations
• Normal form games, dominant strategies, and equilibria
• Two-person games
– Nash equilibria in mixed strategies
• Definition and properties of mixed Nash equilibria
• Existence of Nash equilibria in mixed strategies
– Checkmate: Trees for games with perfect information
• Sequential two-player games
• Equilibria in game trees
– Full house: Games with incomplete information
• The Monty Hall problem
• Analysis of a simple poker variant
– How hard is it to find a Nash equilibrium?
• Nash equilibria in zero-sum games
• Nash equilibria in general normal form games
Cooperative Game Theory
– Foundations

• Cooperative games with transferable utility
• Superadditive games
• Stability concepts for cooperative games
– Simple games
• The core of a simple game
• Counting and representing simple games
• Weighted voting games
• Dimensionality
• Power indices
• The Shapley-Shubik index and the Shapley value
• The Banzhaf indices
– Complexity of problems for succinctly representable games
• Games on graphs
• Weighted voting games
• Hedonic games

Teaching
Lecture „Algorithmic Game Theory“: 4 SWS, Exercises: 2 SWS

Algorithms for Sequence Analysis

Responsible for the Module Prof. Dr. Tobias Marschall			**Date** 24.06.2021
Lecturer(s) Prof. Dr. Tobias Marschall			
Language: English			**Modus** Elective Course
Work Load 300 h	**Credits** 10 CP	**Contact Time** 90 h	**Self-study** 210 h
Course Lecture: 4 SWS Exercises: 2 SWS	**Turnus** Each Summer Term	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences

After completing the course, students are able to

- state concepts for different data structures to index strings
- explain algorithms to build these data structures
- explain different algorithms for text search and sequence alignment
- design and implement advanced algorithms for sequence analysis
- analyze and discuss the merits of different algorithms both in terms of asymptotic runtime and practical performance

Content

This lecture addresses classic as well as recent advanced algorithms for the analysis of sequences,
with an emphasis on algorithms that are fast in practice.
DNA sequencing data are one example that motivates this lecture,
but the focus of this course is on algorithms and concepts that are not specific to bioinformatics.

- Full text search without index
- Approximate pattern matching
- Suffix trees, enhanced suffix arrays, and linear-time construction algorithms
- Burrows-Wheeler Transform (BWT) and the FM index
- De Bruijn graphs and overlap graphs
- Data compression
- Advanced pairwise alignment algorithms
- Multiple sequence alignment
- Positional Burrows-Wheeler Transform (PBWT)
- Locality sensitive hashing

Teaching
Lecture with (theoretical and practical) exercises

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Advanced Programming and Algorithms

Examination
oral exam

Prerequisites for receiving credit points
The weekly exercise sheets come with programming tasks and theory tasks.
To be eligible to take the exam, students have to earn 50% of programming tasks and 50% of theory tasks.

Study Program
M.Sc. Artificial Intelligence and Data Science

Module accessible for other Study Programs
M.Sc. Computer Science

Weight in overall rating
The mark given will contribute to the final grade in proper relation to its credit points.

Algorithms in Comparative Genomics

Responsible for the Module Jun.-Prof. Dr. Daniel Dörr			**Date** 22.07.2024
Lecturer(s) Jun.-Prof. Dr. Daniel Dörr			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Each Winter Term	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After completing the course, students are able to

- explain the challenges in studying genome rearrangements,
- evaluate the tractiblity of computational problems derived from biological phenomena
- explain the algorithmic solutions to these problems,
- apply the discussed algorithmic concepts to other areas of research

Content

Genome rearrangements are mutations that permute blocks of DNA sequence in a genome. This class
covers algorithmic techniques used in the computational analysis of genome rearrangement problems. The
studied algorithms are mostly combinatorial by nature.
The course sets out to detail the problems of - computing rearrangement distances, - identifying loosely
conserved genomic regions in face of rearrangements, - haplotype phasing, and - reconstruction of founder
sequences.

Teaching

Lectures and exercises

Prerequisites for attending

Examination

Usually oral exam

Prerequisites for receiving credit points

Achieving at least 50% of the points in weekly programming and theory exercises to get admission to the exam and passing the exam.

Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points.
Further Information

Applications of Transformer Networks in Bio- and Cheminformatics

Responsible for the Module Dr. Alexander Kroll			**Date** 16.10.2023
Lecturer(s) Dr. Alexander Kroll			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 30	**Duration** 1 Semester

Learning results & Competences

The course teaches how to apply Transformer Networks to problems in bioinformatics and cheminformatics. Students will learn best practices for (i) training and fine-tuning Transformer Networks with molecules (proteins or small molecules) as input, (ii) using the generated numerical representations to make predictions for chemical and biological tasks, (iii) training multimodal Transformer Networks that can process more than one molecule modality/type at a time, and (iv) visualising what Transformer Networks learn and how this information can be used to gain biological insight.

Content

- Detailed description of Transformer Networks (TNs)
- Implementation and training of TNs in Pytorch: Self-supervised learning on molecule representations
- Application of TNs to protein amino acid sequences and small molecule SMILES strings (including coverage of the Alphafold, ESM-1b and ChemBERTa models)
- Gradient boosting models (xgboost) and their application to numerical molecular representations
- Best practices for fine-tuning pre-trained TNs
- Multimodal TNs: processing more than one molecule modality simultaneously
- Visualising what TNs learn

Teaching

Lectures with exercises

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: None.

Examination

Written or oral examination

Module accessible for other Study Programs M.Sc. Computer Science
Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points.
Further Information

Category Theory in Machine Learning and Data Science

Responsible for the Module Dr. Peter Arndt			**Date** 18.1.2022
Lecturer(s) Dr. Peter Arndt			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar/Lecture Course: 2 SWS	**Turnus** Irregular	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

The students know the basic notions of category theory. They know how to phrase concepts from Machine Learning, Data Science and probability theory using the language of category theory. They have a principled approach to the analysis of Machine Learning situations and can use this to design new approaches.

Content

Category theory is a unifying language and tool for analyzing and relating mathematical situations. Originally coming from pure mathematics, it is now being applied to many fields, including Machine Learning and Data Science. The categorical formulation of probability theory can be used for the semantics of probabilistic programming languages.

Basic notions:

Categories, functors, natural transformations, monoidal categories, string diagrams, monads

Further topics will be chosen from the recent literature, e.g.

Categorical view on gradient descent and backpropagation, lenses and learners,

Categorical probability theory, Markov categories and applications, Semantics of probabilistic programming, categorical interpretation of KL-divergence, functorial clustering,

Databases and data migration as functors, categorical understanding of persistent homology, toposes in information theory

Teaching

Lectures, seminar talks and discussions

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.

Contentual: None

Examination

Assessment of the presentation or oral exam

Prerequisites for receiving credit points

(1) Active participation in the course

(2) Presentation of a topic together with a written summary or oral exam
Study Program M.Sc. Artificial Intelligence and Data Science

Further Information

Computational Linguistics

Responsible for the Module Prof. Dr. Laura Kallmeyer (kallmeyer@phil.hhu.de)			**Date** 17.05.2019
Lecturer(s) the lecturers of the Department of Comptational Linguistics			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Seminar: 4 SWS	**Turnus** Each Year	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

Students will understand the intricacies of modeling a specific linguistic phenomenon in such a way that it can be processed automatically. Furthermore, they will get to know different techniques

a) for learning such a model from language data,

b) for applying it to new data and

c) for evaluating it in order to assess its adequacy with respect to the phenomenon one wanted to model.

This can include frameworks and representation formats for modeling syntax (the structure of sentences and texts) and semantics (the meaning of sentences and text) and various machine learning and deep learning techniques applied to this.

Content

Teaching

Advanced seminar (depending on the topic including practical exercises besides theoretical sessions)

It is possible to take two seminars of 2 SWS each instead of a single one of 4 SWS

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.

Contentual: none

Examination

Written examination or oral examination or term paper

Prerequisites for receiving credit points

Passing examination

Study Program

M.Sc. Artificial Intelligence and Data Science

150 h	5 CP	60 h	90 h
Course	**Turnus**	**Group Size**	**Duration**
Lecture: 2 SWS Exercises: 2 SWS	Each Summer Term	–	1 Semester

Learning results & Competences

After successful completion of the course, participants will be able to

- Explain the geometric foundations of image formation with a digital camera
- Train deep neural network models for detecting objects of interest in images
- Implement algorithms for inferring 3D information about a scene from a set of overlapping images

Content

Computer vision is a research field which aims to enable machines to interpret and understand visual information from the world around them, in similar ways that humans see. This implies algorithms and mathematical models to analyze and process digital images and videos in order to extract useful information. Typical tasks are object recognition, 3D reconstruction, scene understanding, or motion tracking. Computer vision has become an increasingly important area of research with applications in domains such as medical imaging, autonomous driving, surveilance, virtual and augmented reality, process automation, or optical inspection.

In recent years, the rapid advances in machine learning and deep learning had a great impact on the field of computer vision, and learning algorithms replace many classical solutions to computer vision problems and often provide superior performance.

In this course, we will introduce you to this exciting field. We will cover

- History of computer vision
- Formation of digital images
- 3D geometry and projective geometry
- Classification, segmentation, and object detection
- Stereo reconstruction
- Structure from motion
- Shape reconstruction

In the practical work, we will study a selection of recent scientific papers from this field and

apply a selection of approaches to real-world problems.

Teaching

Create Your Tech Startup

Responsible for the Module Prof. Dr. Steffi Haag			**Date** 23.02.2022
Lecturer(s) Prof. Dr. Steffi Haag			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Each Summer Term	**Group Size** Limited to 30	**Duration** 1 Semester

Learning results & Competences

Students can

- model, analyze, and discuss digital business models and its components
- assess the specific opportunities for and challenges of technology-based businesses
- create, plan, and implement novel tech startups
- pitch their startup idea in front of peers and experts
- present, assess, and give feedback to novel tech business models
- assess their entrepreneurial skills
- collaborate with interdisciplinary peers comprising various competences.

Content

Students explore the entrepreneurial process using a learning by doing methodology.
The lecture and case studies sessions provide and discuss tools and methods of creating, visualizing, and analyzing digital business models (e.g., business model canvas, lean startup, design thinking).
In a group project, students transfer and apply those tools and methods to create, evaluate, plan, and pitch their own tech startup ideas.

Teaching

Lecture „Create Your Tech Startup“, Case Study sessions

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: None

Examination

Business plan, presentations in groups, and class participation

Prerequisites for receiving credit points

Presentations in groups
Written documentation of a business plan
Active class participation in discussions

Study Program
M.Sc. Artificial Intelligence and Data Science

Module accessible for other Study Programs
M.Sc. Computer Science

Weight in overall rating
The mark given will contribute to the final grade in proper relation to its credit points.

Deep Learning: Generative Models

Responsible for the Module Prof. Dr. Markus Kollmann			**Date** 01.05.2019
Lecturer(s) Prof. Dr. Markus Kollmann			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 50 h	**Self-study** 100 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Each Summer Term	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences

Students know how to implement machine learning algorithms in Pytorch and to run it on HPC. They understand central concepts of Machine Learning and are familiar with common Neural Network architectures, based on convolutional and/or attention layers. They know how to implement Deep Generative Models such as Variational Autoencoder, Autoregressive Networks, Normalizing Flow based Networks, and Score based Generative Models. They understand the conceptional differences between the generative models, their advantages, and their shortcomings.

Content

Lectures and Practical Work:
We start with a brief introduction to common neural network structures, such as Convolutional Neural Networks in general and ResNets in particular and show how to implement and train them. We introduce different concepts of generative models and the training objectives behind them. We apply generative models to toy data sets and to the important problem of Protein/RNA folding.

Teaching

Lecture with (theoretical and practical) exercises

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Decent understanding of Machine Learning

Examination

written examination

Prerequisites for receiving credit points

Regular and active participation in the exercises
Passing the examination

Study Program

M.Sc. Artificial Intelligence and Data Science
Module accessible for other Study Programs M.Sc. Computer Science, M.Sc. Biology, M.Sc Biochemistry
Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points.
Further Information Students from Biology and Biochemistry will be assigned 7CP for the course as it takes them significantly more time to carry out the programming exercises

Deep Learning: Representation Learning

Responsible for the Module Prof. Dr. Markus Kollmann			**Date** 01.05.2019
Lecturer(s) Prof. Dr. Markus Kollmann			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 50 h	**Self-study** 100 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Each Summer Term	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences

Students know how to implement machine learning algorithms in Pytorch and to run it on HPC. They understand central concepts of Machine Learning and are familiar with common Neural Network architectures, such as Convolutional Neural Networks. The understand the difference between Maximum Likelihood Learning and Contrastive Learning. They are familiar with data augmentation methods and simple sampling methods.

Content

Lectures and Practical Work:
We start with a brief introduction to common neural network structures, such as Convolutional Neural Networks in general and ResNets in particular and show how to implement and train them. We show how to construct loss functions and how to find analytical expressions for the asymptotically optimal solutions, using Variational Calculus. We introduce Contrastive Learning -- and Self-supervised Learning in general -- as methods for Representation Learning. We introduce Autoencoders -- and Generative Models in general -- as methods for learning the data hyperplane. We discuss why including prior knowledge is the key for the success of Machine Learning Methods in diagnostic and therapeutic applications.
In the practical work we apply Representation Learning to detect heart arrhythmias from real time series data of patients and anomalies in (medical) image data.

Teaching

Lecture with (theoretical and practical) exercises

Fairness in Machine Learning

Responsible for the Module Prof. Dr. Stefan Conrad			**Date** 16.10.2025
Lecturer(s) Dr. Manh Khoi Duong			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Irregular	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

The goal of this course is to introduce the key concepts, methods, and challenges related to fairness in machine learning. Students will explore foundational issues of discrimination and equity in algorithmic decision-making. They will become familiar with techniques for measuring and mitigating bias in machine learning models, and will be able to apply and adapt these methods to various applications. The students will get familiar with the Python package AIF360 as well as other packages that deal with algorithmic fairness. Additionally, students will learn how to critically examine fairness criteria and analyze the trade-offs between fairness and other performance metrics. They will also be capable of assessing the ethical and societal implications of AI systems.

Content

- Motivation: History, EU laws against discrimination, AI Act
- Fairness Criteria: Group Fairness, Individual Fairness, Causal Fairness, Impossibility of Fairness Theorem
- Quantifying Discrimination
- Bias mitigation algorithms for Classification, Regression, Ranking (Information Retrieval)
- Bayesian Statistics for Uncertainty Estimation
- Social Welfare: Utilitarianism, Rawlsian, and Nash Social Welfare

Teaching

Lecture with (theoretical and practical) exercises

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.

Game Theory

Responsible for the Module Prof. Dr. Hans-Theo Normann			**Date** 15.10.2025
Lecturer(s) Prof. Dr. Hans-Theo Normann and teaching/research assistants of the DICE			
Language: English			**Modus** Elective Course
Work Load 240 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 90 h
Course Lecture and tutorial: 2+2 SWS	**Turnus** Each Summer Term	**Group Size** Limited to 25	**Duration** 1 Semester

Learning results & Competences

By the end of the module, students will be able to

- repeat and exemplify fundamental and advanced concepts of the game theory which will be used in the following master degree programme;
- represent and exemplify strategic behaviour of players and their interactions by means of the game theory;
- apply the gained knowledge exemplary on chosen areas of economics;
- simplify complex economic issues by the means of the game theory;
- adopt and transact the gained expertise of course 1 by the means of practical tasks.

Content

Course 1: Game Theory

1. static games with complete information
2. dynamic games with complete information
3. static games with incomplete information
4. dynamic games with incomplete information

Course 2: Game Theory – tutorial

Cf. contents of course 1.

Teaching

Game Theory

Prerequisites for attending

A good understanding of Microeconomics and previous knowledge in Mathematics

Examination

Written exam at the end of the summer semester (60 minutes)

Prerequisites for receiving credit points

Successful participation in the exam. The exam will be passed if the grade is at least sufficient (4,0).

Study Program

M.Sc. Artificial Intelligence and Data Science
Module accessible for other Study Programs M.Sc. Business Administration; M. Sc. Economics; M.Sc. Mathematics
Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points.

Image Processing and Analysis

Responsible for the Module Prof. Dr.-Ing. Johannes Stegmaier			**Date** 08.10.2026
Lecturer(s) Prof. Dr.-Ing. Johannes Stegmaier			
Language: English			**Modus** Elective Course
Work Load 300 h	**Credits** 10 CP	**Contact Time** 120 h	**Self-study** 180 h
Course Lecture: 4 SWS Exercises: 2 SWS	**Turnus** Each Summer Term	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

- Understanding the physical basics of image formation and representation for classical images as well as fundamentals of microscopy and medical imaging.
- Understanding various concepts for preprocessing, filtering, segmentation, registration, and visualization of image data and point clouds.
- Advanced understanding of practically applying image processing and analysis methods to 2D and 3D image data.
- Understand frequently used classical and deep learning-based algorithms for image processing and analysis.
- Hands-on experience with most of the presented concepts in Python-based exercises.

Content

The lectures' focus is put on conveying a comprehensive overview of image processing and analysis using both classical and state-of-the-art deep learning-based methods.
More specifically, the following aspects are covered:

- Digital Imaging Fundamentals (visual information, electromagnetic spectrum, human eye, color models, imaging techniques, camera sensors (CCD/CMOS), color sensors, optics (pinhole camera, thin lenses), geometric and chromatic aberrations, fundamentals of microscopy and medical imaging).
- Image Processing Basics (data structures, representation of grids and data values, differentiation on grids, interpolation methods).
- Deep Learning Crash-Course (basic introduction to deep neural networks for understanding recent learning-based architectures for image processing and analysis tasks).
- Point Operations (homogenous point operations, image histograms, histogram equalization, Look-up Tables (LUTs), inhomogeneous point operations, color space transforms).
- Filtering (linear filtering in the spatial and the frequency domain, nonlinear filtering, corner/line/edge detection, structure tensor, deconvolution, mathematical morphology).
- Object Detection (interest point detectors, Harris corner detector, structure tensor, CNN- and Transformer-based object detection).

- Segmentation Algorithms (point-based segmentation, thresholding, region-based segmentation, region-/volume growing, watershed-based segmentation, superpixels and advanced segmentation methods like graph cuts and semantic and instance segmentation with CNNs and transformers).
- Registration (transformations, point-registration (Procrustes approach), iterative closest point algorithm), intensity-based registration, information theoretic approach, similarity measures (sum of squared differences, cross correlation, mutual information, normalized mutual information), interpolation, optimization, 2D-3D registration, deformable registration).
- Generative Models for Data Synthesis (Generative Adversarial Networks, Denoising Diffusion Probabilistic Models).
- Point Clouds (processing, detection, segmentation in point clouds using classical and deep learning-based methods).
- Object Tracking (optical flow, (parametric) contour evolution, deep learning-based tracking).
Examples will focus mostly on biomedical image/video data in 2D and 3D. The accompanying exercises will contain both practical and theoretical parts and practical exercises will be written in Python using Jupyter Notebooks.

Teaching
Lecture accompanied with theoretical and practical exercises.

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Basic knowledge in signal processing is advantageous. Practical programming exercises will be written in Python, i.e., basic programming experience is expected.

Examination
Written examination

Prerequisites for receiving credit points
Regular and active participation in the exercises
Passing the examination

Information Theory

Responsible for the Module Dr. Peter Arndt			**Date** 15.12.2020
Lecturer(s) Dr. Peter Arndt, Dr. Konrad Völkel			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 20	**Duration** 1 Semester

Learning results & Competences

In this module students get to know fundamental and advanced concepts of information theory, their relation to coding, data compression and signal transmission. They get a better understanding of randomness, as captured by the concepts of entropy, information loss and Kolmogorov complexity. They obtain a principled view on general assumptions and techniques in machine learning, like the information bottleneck. They know applications to statistics and machine learning.

Content

Entropy, conditional, joint and relative entropy, mutual information and their interrelations, Source Coding Theorem, characterizations of entropy and relative entropy, Renyi and Tsallis entropy, universal source coding, Kolmogorov complexity and connection to entropy, applications of Kolmogorov complexity, entropy of stochastic processes, channel capacity and Channel Coding Theorem, differential entropy, Gaussian channel, maximum entropy distributions, higher information theoretic invariants, applications.

English			Elective Course
Work Load	**Credits**	**Contact Time**	**Self-study**
300 h	10 CP	90 h	210 h
Course	**Turnus**	**Group Size**	**Duration**
Lecture: 4 SWS Exercises: 2 SWS	Irregular	–	1 Semester

Learning results & Competences

Foundations of Linear Programming. Students know the definitions of linear programs (LPs), and their standard forms. They can solve low-dimensional LPs geometrically. They understand and can apply the Simplex method and the fundamental theorem of Linear Programming. They understand and can apply the concept and proofs of weak and strong duality.
Integer Linear Programming. Students know the definition of integer linear programs (ILPs) and the fundamental difference to LPs in terms of computational complexity. They understand the relation to combinatorial optimization problems. They know and can apply different methods to solve ILPs: Branch-and-Bound based on the LP relaxation, cutting planes, Branch-and-Cut and Lagrangian relaxation. They understand the concept of separation.
Network Flows. Students understand the concepts of networks and flows in networks. They can distinguish different variants and special cases of flow problems. They can compute maximum flows with the augmented path method (Ford-Fulkerson) and can prove why the method works. They understand the relation to duality in form of the max-flow-min-cut theorem.
Applications. Students can apply different modeling techniques to develop ILP formulations for combinatorial optimization problems. Examples include maximum clique, phylogeny reconstruction and the traveling salesman problem. They can solve real-world instances of these problems with self-written Python code using external optimization libraries.

Content

Lecture:
Foundations of Linear Programming. Linear Programs and their geometric interpretation. Duality. The Simplex method.
Integer Linear Programming. Linear programming-based Branch-and-Bound. Cutting planes. Branch-and-Cut. Lagrange relaxation.
Network Flows. Theory and algorithms.
Applications. Selected applications of linear optimization techniques from bioinformatics and other fields.

Exercises:
In the exercises the content of the lecture is applied and deepened. For that the exercises contain theoretical as well as practical elements. The students use professional linear and integer linear programming modeling software and solvers to build solve applied programming exercises.

Introduction to Logic Programming

Responsible for the Module Prof. Dr. Michael Leuschel			**Date** 10.4.2019
Lecturer(s) Prof. Dr. Michael Leuschel			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 90 h	**Self-study** 60 h
Course Practical: 4 SWS Lectures: 2 SWS	**Turnus** Each Winter Term	**Group Size** Limited to 30	**Duration** 1 Semester

Learning results & Competences

To understand and be able to use the main concepts of propositional and predicate logic
To understand the logic programming paradigm and be able to use it for problem solving
To be able to write Prolog programs in a logical style
To be able to use informed search algorithms (A*) and develop AI algorithms for game playing (Minimax)

Content

An important part of this unit is devoted to the study of logic. The discipline of logic is concerned both with proving theorems and also with drawing inferences from existing knowledge. The unit covers basic programming concepts of logical systems, resolution logic and horn clauses. This logical development provides a foundation for introducing the main concepts of logic programming. The unit also includes a practical introduction to the main features of Prolog, the language which implements this style of programming. Theoretical and practical topics are interleaved, the course as a whole dividing roughly equally between logic and theory and practical programming. The course covers many AI topics such as informed search algorithms (A*), constraint satisfaction and game playing (Minimax, Alpha-Beta pruning).

Teaching

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Foundations of software development and programming

Examination

Written examination (80% of grade)
Assessment of practical work (20% of grade)

Prerequisites for receiving credit points

Successful participation at the practical work

Work Load 150 h	**Credits** 5 CP	**Contact Time** 50 h	**Self-study** 100 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Each Summer Term	**Group Size** –	**Duration** Block Course, 2 Weeks

Learning results & Competences

Students are able to use the statistical programming language R and the software OpenBUGS for Bayesian reasoning. They understand the significance of computer simulations and Bayesian methods for modelling. They can classify different simulation methods.

Content

Introduction to Bayesian reasoning: Probability Theory and introduction to computer simulations, introduction to Bootstrap, introduction to Bayesian modelling, introduction to multivariate distributions and multiple parameter models
Monte Carlo simulation methods: Monte Carlo method for computing integrals, Rejection Sampling, Importance Sampling, Sampling Importance Resampling
Markov chain Monte Carlo methods: Introduction to Markov chains, Metropolis-Hastings algorithm, directed acyclic graphs, Gibbs sampling, MCMC output analysis
Statistical Modelling: Regression modelling, analysis of multiple contingency tables, introduction to hierarchical models

Markov Chains (Ausgewählte Kapitel der Stochastik)

Responsible for the Module Prof. Dr. Nils Detering			**Date** 06.11.2025
Lecturer(s) Prof. Dr. Nils Detering, Prof. Dr. Peter Kern			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 45 h	**Self-study** 105 h
Course Lecture: 2 SWS Exercises: 1 SWS	**Turnus** Irregular	**Group Size** Limited to 20	**Duration** 1 Semester

Learning results & Competences

Students acquire a thorough understanding of the fundamental principles and mathematical theory of Markov chains. They are able to apply mathematical definitions and theorems to independently analyze and solve selected problems and to present their results in a clear and rigorous manner. Moreover, they develop systematic and efficient methods for acquiring and applying new knowledge. Students will gain a deep understanding of key techniques and convergence results for Markov models, enabling them to adapt and implement algorithms based on Markov chains, apply them to data, and critically evaluate the results.

Content

The first part of the lecture introduces the fundamental mathematical theory of Markov chains, including the Markov property, random walks, transition matrices, transition graphs, the Chapman–Kolmogorov equation, classification of states, irreducibility, periodicity, recurrence and transience, the renewal equation, the strong Markov property, equilibrium distributions, and ergodic theorems.
The second part focuses on practical applications of these concepts, covering topics such as branching processes, absorption times, the Markov Chain Monte Carlo (MCMC) method, the Metropolis and Gibbs samplers, the Ising model, simulated annealing, cooling schedules, Markov Decision Processes, and Reinforcement Learning.

Exercise Course:

The lecture is accompanied by weekly exercise sessions that deepen the students' understanding of the mathematical theory and its practical applications. Students first work on assigned problems independently; the corrected solutions are then presented and discussed in the exercise sessions.

Teaching

Lecture with exercise course.

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Passed exam in „Mathematical and Statistical Foundations in Data Science“. It is further recommended to have taken a course on stochastics previous to this course.

Examination
Learning portfolio consisting of:
(1) Competence area knowledge (100% of final mark): Written exam on the contents of lectures and exercise classes.
(2) Application of acquired knowledge (40% of exercise points as admission to the final exam): Practical exercises during the semester.

Prerequisites for receiving credit points
(1) Passing the exam.
(2) Regular and active attendance to exercises.

Study Program

Master's Seminar: Advanced Machine Learning for Medical Data

Responsible for the Module Prof. Dr.-Ing. Johannes Stegmaier			**Date** 08.10.2026
Lecturer(s) Prof. Dr.-Ing. Johannes Stegmaier			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Each Summer Term	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

Students will learn to work with primary literature, to conceive a thorough understanding of a new topic and to critically dispute the published findings. Each student will be assigned a recent original paper, which should be presented to the fellow students in the form of an oral presentation (including related literature, an introduction to the general problem and a presentation of the core messages of the assigned paper). In addition to the oral presentations, the respective findings should be summarized in the form of a short technical report (5-8 pages). The seminar will be held in English, to prepare students for the participation in international scientific meetings.

Content

The seminar “Advanced Machine Learning for Medical Data” will discuss research papers from the field of machine learning for biomedical data (e.g., images, point clouds, video, …) that were recently published in top-tier conference proceedings and/or journals. Topics will include (among others): machine learning-based image enhancement, image registration, object detection, segmentation and object tracking with a focus on biomedical data.

Teaching

Mixture of on-site sessions, personal consultation and presentation blocks at the end of the semester.

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: none

Examination

Assessment of presentation and term paper

Prerequisites for receiving credit points

Presence and active participation in the seminar sessions

Study Program

Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points.
Further Information Literature: Yearly changing research papers that will be distributed among the students in the first session.

Master's Seminar: Advances in Computer Vision

Responsible for the Module Jun.-Prof. Dr. Kira Maag			**Date** 14.03.2025
Lecturer(s) Jun.-Prof. Dr. Kira Maag			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** –	**Duration** 1 Semester

Learning results & Competences
Students have in depth understanding about actual computer vision methods and their applications.

Content
Computer vision describes a field within artificial intelligence in which images/videos are processed to extract information and understand content. Applications are, for example, automated driving, medical diagnosis or robotics, where sensors such as cameras, LiDAR or radar are used to analyze the scenes. In this seminar actual computer vision methods and their applications are studied.

Teaching
Weekly seminar sessions

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: none

Examination

Master's Seminar Advances in Data Science

Responsible for the Module Prof. Dr. Stefan Dietze			**Date** 15.10.2025
Lecturer(s) Prof. Dr. Stefan Dietze			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After successful completion, students will have a deepened understanding of state-of-the-art methods and applications within data science, respectively the covered sub areas. Participants will have gained experience in critically assessing, summarising and presenting contemporary state-of-the-art research.

Content

Learning from data in order to gain useful insights is an important task, generally covered under the data science umbrella. This involves a wide variety of methods from areas such as statistics, machine learning, information retrieval, NLP or data and knowledge engineering. The goal of this seminar is to deepen the understanding about data science & engineering techniques through studying and critically evaluating recent state-of-the-art literature in the field. Discussed works focus on data science problems and applications in areas such as natural language understanding, (social) web mining or search and recommendation and touch specifically on practical problems with respect to reproducibility, data quality, fairness or explainability. Participants will be introduced to the critical assessment and discussion of recent scientific developments, thereby learning about emerging technologies as well as gaining the ability to evaluate and discuss focused scientific works. Participants will be provided with selected literature from top-tier scientific venues. Each participant will review independently 1-2 publications which are then presented and discussed with the entire student participants.

Master's Seminar: Algorithmic Advances in Computational Genomics

Responsible for the Module Prof. Dr. Tobias Marschall			**Date** 24.07.2024
Lecturer(s) Prof. Dr. Tobias Marschall			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Each Winter Term	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After completing the course, students are able to

- read and explain original research articles in computational genomics,
- create their own examples to illustrate a new algorithm,
- prepare and give oral presentations on scientific topics,
- write a scientific article for given content, and
- ask questions and provide constructive feedback on other presentations.

Content

In this seminar, we explore current literature on new algorithms and computational techniques that promise to have an impact on the field of genomics. The seminar is offered each winter term and in each year we will offer topics according to recent advances from the areas of:

- sequence analysis
- index structures for sequences
- sequence graphs and pangenomics
- genome-wide association studies
- population genetics

Teaching

Seminar Algorithmic Advances in Computational Genomics

Prerequisites for attending

Contentual: Contents of modules Advanced Programming and Algorithms for Sequence Analysis

Master's Seminar: Combinatorial Optimization in Bioinformatics

Responsible for the Module Prof. Dr. Gunnar Klau			**Date** 03.10.2020
Lecturer(s) Prof. Dr. Gunnar Klau, Eline van Mantgem			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 20	**Duration** 1 Semester

Learning results & Competences
Students acquire knowledge about state-of-the-art combinatorial optimization algorithms in bioinformatics. They learn and practice how to read, understand, discuss, present and write about scientific literature and further develop their critical thinking skills.

Content
Many problems in bioinformatics can be formulated as combinatorial optimization problems. This module provides advanced knowledge for identifying, formulating, and solving such problems. Based on a selection from current bioinformatics topics – usually by studying recent conference papers – students learn about the application of important optimization tools and techniques such as dynamic programming, graph algorithms, linear and integer linear programming, Lagrangian relaxation, parameterized algorithms and satisfiability solving.

Teaching
Seminar

Further Information

Master's Seminar: Computational Argumentation

Responsible for the Module Jun. Prof. Gabriella Lapesa			**Date** 12.10.2023
Lecturer(s) Jun. Prof. Gabriella Lapesa			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 26	**Duration** 1 Semester

Learning results & Competences

After this course the students students will be familiar with the conceptual building blocks of computational argumentation (e.g., claim, stance, evidence) and with the challenges and interdisciplinary applications of the NLP modeling of arguments in text. Beyond the specific topic, an important meta-skill that we will practice in class will having a critical attitude towards scientific texts, both at the level of the write-up (strength, clarity) and at the level of its content (reproducibility, ethical issues).

Content

Argument mining is a highly interdisciplinary field in Natural Language Processing. Given a linguistic unit (a speech, an essay, forum post, or a tweet), its goal is to determine what is the position adopted by the author/speaker on a certain topic/issue (i.e., whether or not vaccinations should be enforced), and to identify the evidence (if any) provided by the speaker for its position. In this seminar we will read and discuss recent papers in Argument Mining, based on a selection structured along three main coordinates: the core notion of Argument Quality (How do we recognise good arguments?); the modeling challenges related to the automatic extraction of argument structures (multilingualism; bias; evaluation of different modeling architectures); applications (computational social science; education).

Teaching

Seminar „Master’s Seminar on Computational Argumentation“

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science" or "Computer Science"
Contentual: none, but having attended the lecture „Natural Language Processing“ is highly recommended

Examination

Assessment of the presentation and coursework

Prerequisites for receiving credit points

(1) Active presence in the seminar
(2) Presentation of a paper
(3) Active participation in discussions
(4) Review of 4 papers in the seminar reading list

Study Program
M.Sc. Artificial Intelligence and Data Science

Module accessible for other Study Programs
M.Sc. Computer Science

Weight in overall rating
The mark given will contribute to the final grade in proper relation to its credit points.

Further Information

Master's Seminar: Computational Multiomics

Responsible for the Module Jun.-Prof. Dr. Daniel Dörr			**Date** 15.02.2024
Lecturer(s) Jun.-Prof. Dr. Daniel Dörr			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 50 h	**Self-study** 100 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences

After completing the course, students are able to

- outline the current state of research on multiomics data integration,
- critically disseminate scientific papers,
- give oral presentations on scientific topics, and
- write a scientific review.

Content

Modern laboratory equipment enables high-throughput experiments that provide detailed insights into molecular biology.
These give rise to several branches of research including genomics, transcriptomics, proteomics, metabolomics, epigenomics, and metagenomics, with -omics meaning “the total of some sort”.
Omics experiments produce massive amounts of data that are subject of a variety of challenging computational problems.

In this class,

- various multiomics experiments,
- methods for multiview learning, multimodal analysis, and deep clustering, and
- applications in multiomics data analysis presented and discussed.

Participants will be assigned individual topics.
The selection and matching between topics and participants will be determined in the first meeting of the seminar.

Teaching

Seminar talks.

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“. Contentual: Advanced Programming and Algorithms
Examination Graded seminar talk and written assignment
Prerequisites for receiving credit points - Scientific essay on an assigned topic - Oral presentation The final grade is composed of 75% written and 25% oral (presentation+participation) performance.
Study Program M.Sc. Artificial Intelligence and Data Science
Module accessible for other Study Programs M.Sc. Computer Science
Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points.

Master's Seminar: Digital Innovation and Entrepreneurship

Responsible for the Module Prof. Dr. Steffi Haag			**Date** 15.10.2025
Lecturer(s) Prof. Dr. Steffi Haag			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 20	**Duration** 1 Semester

Learning results & Competences

After completing the course, students are able to
independently prepare and interpret the most important theories, concepts, methods, and results related to the field of digital innovation and entrepreneurship,
analyze scientific literature in order to independently define relevant research problems,
apply conceptual, quantitative, or qualitative research methods to analyze these problems,
write and review seminar papers,
critically reflect, present, and discuss the topic, research design, and results in the context of the seminar,
provide appropriate feedback on complex challenges, and
develop teamwork skills through collaboration with fellow students.

Content

The seminar covers a selection of current research topics in the area of Digital Innovation and Entrepre- neurship.
Students learn theories, concepts, processes, tools, and methods surrounding IT-based innovation, business models, user experience, and entrepreneurship.
Topics will be introduced and assigned in the first session.
During the semester, students will work on their seminar paper.
The results will be presented and discussed in the middle and at the end of the semester.
In addition, an introduction to scientific writing is given at the beginning.

Teaching

Seminar „Digital Innovation and Entrepreuneurship", Session on scientific writing

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science".
Contentual: None

Examination

Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points
Further Information

Master's Seminar: Ethics in Natural Language Processing

Responsible for the Module			Date
Jun. Prof. Gabriella Lapesa			12.10.2023
Lecturer(s)			
Jun. Prof. Gabriella Lapesa			
Language:			**Modus**
English			Elective Course
Work Load	**Credits**	**Contact Time**	**Self-study**
150 h	5 CP	30 h	120 h
Course	**Turnus**	**Group Size**	**Duration**
Seminar: 2 SWS	Irregular	Limited to 26	1 Semester

Learning results & Competences

After this course, the students will be familiar with the literature on the reflection on ethical issues in NLP, fro the perspective of specific task and applications but also, at a higher level, on the dynamics of the debate regarding what needs to be done to solve these issues (Who are the stakeholders? what are the measures already in place, and do they work?, etc.) Beyond the specific topic, an important meta-skill that we will practice in class will having a critical attitude towards scientific texts, both at the level of the write-up (e.g., strength, clarity) and at the level of its content (e.g., reproducibility).

Content

Natural Language Technologies and, more broadly, Machine Learning, are everywhere, so embedded in everyday life that we, users, sometimes lose awareness of their presence. As scientists as researchers, however, our role is to keep track of the potential dangerous outcomes of these technologies, and to act as an interface between them and the general public. In the course, we will go through a selection of papers on ethical issues related ot NLP (e.g., bias, manipulation, privacy, etc.) with the goal of building together our taxonomy of these issues, along with our reflection on the steps to be taken to address them.

Teaching

Seminar „Master's Seminar on Ethics in NLP"

Master's Seminar: Knowledge (Graphs) in Natural Language Processing

Responsible for the Module Prof. Dr. Stefan Dietze			**Date** 15.10.2025
Lecturer(s) Prof. Dr. Stefan Dietze			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

Throughout the seminar, students will develop a deepened understanding of state-of-the-art methods and applications at the intersection of knowledge graphs and NLP. Participants are able to systematically review, summarise and critically evaluate scientific literature.

Content

Natural Language Processing (NLP) has seen significant progress throughout the past decade that culminated in the rise of large language models (LLMs), driven by representation learning on massive amounts of unstructured data. On the other hand, symbolic AI utilises knowledge engineering, representation and extraction techniques that contribute to large knowledge graphs (KGs) such as Wikidata and more domain- and task specific knowledge representations that have seen a renaissance to complement statistical approaches to NLP. Such knowledge representations and KGs are used widely as ingredient of NLP techniques, for instance as part of named entity disambiguation, and to address known deficiencies of LLMs. On the other hand, NLP methods and LLMs are used to automatically construct knowledge from unstructured text, where the retrieval of knowledge from the parameters of pretrained LLMs is a more recent topic that has gained widespread attention. In this seminar, we will discuss state-of-the-art research at the intersection of KGs and NLP. Each participant will be given one recent publication to read, assess and present and to facilitate wider discussion within the seminar.

Teaching

Seminar „Knowledge (Graphs) in Natural Language Processing“

Prerequisites for attending

Examination

Written exam

Prerequisites for receiving credit points

Active participation, handing in compact written assignments to chosen topics, presentation of the topic, evaluating other student's papers

Study Program

Master's Seminar: NLP for Political Science

Responsible for the Module Jun. Prof. Gabriella Lapesa			**Date** 18.01.2024
Lecturer(s) Jun. Prof. Gabriella Lapesa			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 28	**Duration** 1 Semester

Learning results & Competences

After this course, the students will be familiar with the literature on the application of Natural Language Processing methods to address Political Science questions. While the core of the course is on the NLP methods, the students will also benefit from the exposure to Political Science literature on the selected issues. Beyond the specific topic, an important meta-skill that we will practice in class will having a critical attitude towards scientific texts, both at the level of the write-up (e.g., strength, clarity) and at the level of its content (e.g., reproducibility).

Content

In this seminar, we will explore the potential of the application of Natural Language Processing methods to a selection of questions coming from Political Science (PolSci). The selection of papers will be structured along three main coordinates. The first coordinate has to do with the phenomena that have been investigated at this interdisciplinary intersection, e.g., media manipulation strategies like agenda-setting (the targeted selection of what is reported in the news, as a distraction factor) or framing (the targeted selection of certain aspects of a phenomenon, to bias the public towards a certain conceptualization of it); the dynamics of policy debates (discussions regarding the set of laws to be adopted in a certain domain, i.e., immigration) are another PolSci phenomenon which has been investigated with the support of NLP methods. The second coordinate has to do with the textual typology on which the analysis takes place: policy debates, for example, take place in a parliament, are summarized in newspapers, and widely debated on the social media. The third coordinate is methodological: What are the challenges of the interdisciplinary synergy between NLP and PolSci? What are the potential for the use of Large Language Models on this type of research questions? How about the risks?

Teaching

Seminar „Master's Seminar on NLP for Political Science“

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science" or "Computer Science"

Contentual: none.

Examination
Assessment of the presentation and coursework

Master's Seminar: Property Testing

Responsible for the Module Dr. Anja Rey			**Date** 01.03.2022
Lecturer(s) Dr. Anja Rey			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After completion the students can

- extract significant contents of a given topic and to reproduce them in a written and oral form,
- evaluate the readability and technical quality of other abstracts,
- plan and hold a presentation, and
- ask and answer adequate questions and to give and take constructuctive feedback.

Content

We study algorithmic techniques that allow us to solve relaxed decision problems efficiently such as testing whether a sparse graph is connected or „far away“ from being connected in sublinear time. Individual topics can include state of the art research in this area.

Teaching

Weekly seminar sessions

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.

Contentual: none

Examination

Assessment of the abstract and the presentation

Prerequisites for receiving credit points

- write an abstract about a given topic
- provide feedback via a peer review
- present your topic
- ask and answer questions

Further literature will be announced in the beginning of the seminar according to the individual topics.

Master's Seminar: Subjectivity in NLP

Responsible for the Module Jun. Prof. Gabriella Lapesa			**Date** 18.01.2024
Lecturer(s) Jun. Prof. Gabriella Lapesa			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 28	**Duration** 1 Semester

Learning results & Competences

After this course, the students will be familiar with a range of dimensions of individual variation (socio-demographics, personality traits, systems of morals and values) and with the conceptual, ethical and technical challenges that the NLP modeling of subjectivity implies. Beyond that, an important meta-skill that we will practice in class will having a critical attitude towards scientific texts, both at the level of the write-up (e.g., strength, clarity) and at the level of its content (e.g., reproducibility).

Content

This course will focus on the defining features of individuals, on what makes them unique or establishes their membership to a specific group, and on the challenges that these features pose to the development and use of Natural Language Processing models.

In the first part of the seminar, we will focus on the NLP modeling of what defines individuals: our obvious departure point will be socio-demographic variables, and we will then further proceed to personality traits and systems of morals and values.

The second part of the seminar will take a closer look at Large Language Models. What are the methods and challenges to define the socio-demographics of LLMs? Humans exhibit a wide range of psychological diversity: which humans do LLMs resemble?

In the third part of the seminar, we will take a methodological angle and review research on the “learning from disagreements” challenge. NLP approaches which rely on gold standards typically average annotators’ perspectives; however, in particular when it comes to highly subjective phenomena, disagreements are a feature to take into account in the modeling, and not a bug to fix.

Master's Seminar on Privacy-preserving Machine Learning

Responsible for the Module Prof. Dr. Milica Gašić			**Date** 23.2.2022
Lecturer(s) Prof. Dr. Milica Gašić			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 24	**Duration** 1 Semester

Learning results & Competences

After completion students have in-depth understanding of various methods and typical applications from the area of privacy-preserving Machine Learning. They can independently review and evaluate scientific publications and improve their presentational skills.

Content

This seminar series will cover several classic papers in the topic of privacy preserving machine learning (PPML). PPML is a new area of Machine Learning that explores mechanisms to protect the owners of data from their data being leaked, while simultaneously allowing for insights to be gathered. Example applications include enabling models to be trained on data from private remote data, such as data on phones or in hospitals, and executing models on data without leaking the contents of the model. Example techniques include homomorphic encryption, secure multi-party computation, differential privacy and federated learning. This seminar aims to build upon and enhance the learnings from the lectures such as „Machine Learning“ and „Deep Learning" by independent study of such scientific publications. Each week, 1-2 of the participants of the seminar will give a presentation, followed by a discussion involving all participants, focussing on content as well as the delivery of a good scientific presentation. In addition, each presenter is required to hand in a short summary of their presentation afterwards.

Teaching

Master's Seminar: Theory of Mind

Responsible for the Module Prof. Dr. Milica Gašić			**Date** 14.03.2025
Lecturer(s) Prof. Dr. Milica Gašić			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 24	**Duration** 1 Semester

Learning results & Competences

The students will gain an understanding of the concept of the theory of mind and the most important recent developments in this field. They can independently review and evaluate scientific publications and improve their presentational skills.

Content

In this seminar we will review a number of works related to the concept of the theory of mind. The theory of mind refers to ability to understand beliefs and emotions of the interlocutor and as such are hallmark of human intelligence. With the rise of large language models (LLMs) and their impressive capabilities, there has been a lot of interest in the question if and to which extent LLMs possess the theory of mind. In this seminar, we will cover a number of important works in this area and related areas of computational psychology and cognitive science and not limit ourselves to LLMs.

Teaching

Further Information

Master's Seminar on Word Embedding Spaces

Responsible for the Module Prof. Dr. Milica Gašić			**Date** 21.02.2025
Lecturer(s) Dr. Benjamin Ruppik			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 26	**Duration** 1 Semester

Learning results & Competences

After completion students have in-depth understanding of various methods and techniques for constructing word embeddings,
can name applications for word embeddings in natural language processing and dialog systems,
can independently review and evaluate scientific publications and improve their presentational skills.

Content

In a word embedding we encode language by associating to each word a vector in some ambient space, such that words which have similar meaning are close together in the space. When words are modelled as vectors or points in an ambient high-dimensional space, this is called an embedding.
Words which are used in similar contexts usually have similar meanings: The distributional hypothesis states that words which frequently appear in similar contexts are similar themselves. This makes it possible to acquire meaningful representations from unlabelled data such as text from Wikipedia, books, or news headlines.
In this seminar, we will study recently published techniques for finding both static and contextual embeddings: In a static embedding there is one fixed embedding for each word in the vocabulary. In a contextual embedding the vector we associate to a word is distinct if it is used in a different context. Another important, but challenging aspect is evaluating the quality of a word embedding, which form the basis of many natural language processing tasks such as document search, document classification, information retrieval, language translation and sentiment analysis.

- Static word embeddings: Frequency based methods, word2vec, GloVe, fastText
- Contextual word embeddings: ELMo, Transformer, BERT, Sentence Embeddings
- Evaluation of word embeddings, Geometry of the word embedding space, Bias in word embeddings, Sentiment, Multi-lingual word embeddings
- Topological Data Analysis

Teaching
Seminar „Master's Seminar on Word Embedding Spaces“

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Lecture „Machine Learning“

Examination
Assessment of the presentation

Prerequisites for receiving credit points
(1) Active presence in the seminar
(2) Presentation of a topic
(3) Active participation in discussions
(4) Written summary of the topic (“extended abstract”, maximum 2 pages)

Further Information

Master Seminar Reproducibility in Bioinformatics Research

Responsible for the Module Prof. Dr. Gunnar Klau			**Date** 03.10.2020
Lecturer(s) Prof. Dr. Gunnar Klau			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 20	**Duration** 1 Semester

Learning results & Competences

Students learn about the reproducibility crisis in computational research and reasons why it exists. In group work they practice how to read, understand, discuss, present and write about scientific literature and further develop their critical thinking skills. They will advance their practical programming and data analysis skills by reproducing published research. They will learn how to use tools like Conda, Snakemake and Docker to produce highly reproducible research.

Content

Scientific data analysis is becoming increasingly important in research. In bioinformatics in particular, the combination of enormously growing data volumes, lack of standards and incentives and poor programming practices has led to a reproducibility crisis. Scientific software is too often inadequately documented, inefficiently programmed, and unmaintained. In this seminar, we will highlight these flaws by attempting to reproduce the data analysis of selected original papers. In addition, we will learn how to do it correctly by implementing these analyses using tools like Conda, Snakemake and Docker and, if successful, making them availlable on certified online storage services.

Methods for Population Genetics

Responsible for the Module Prof. Dr. Tobias Marschall			**Date** 06.07.2023
Lecturer(s) Prof. Dr. Tobias Marschall			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 45 h	**Self-study** 105 h
Course Lecture: 2 SWS Exercises: 1 SWS	**Turnus** Each Winter Term	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences

After completing the course, students are able to
- explain the fundamental principles and terms used in population genetics,
- analyze and compare the effects of mutation, migration and selection on genotypes in a population,
- describe analyses of genetic variation in the context of phenotypic traits, and
- apply the algorithmic and statistical concepts of population genetics to modern sequencing data sets.

Content

Population Genetics studies the distribution of genetic information across populations under varying conditions. This lecture provides the necessary methods to answer questions such as: Is there evidence for selection pressure on a certain gene? How can ancient migration patterns be retraced based on genetic information? How can quantitative traits such as disease susceptibility be attributed to genetic loci?
- Hardy-Weinberg principle
- Genetic drift and Wright-Fisher model
- Kolmogorov forward and backward equations
- Mutation and selection
- Linkage disequilibrium
- Population structure and inbreeding
- Haplotype phasing and imputation
- Genome-wide association studies and quantitative traits

Teaching

Lecture with (theoretical and practical) exercises

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: None

Examination oral exam
Prerequisites for receiving credit points Regular and active participation in the exercises: 50% of the points from the exercise sheets. Passing the examination

Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Irregular	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

Natural Language Processing (NLP). Students understand basic methods and algorithms for NLP and can explain them. They are able to design a NLP pipeline for a dedicated task and to implement it using adequate libraries. The students know how to evaluate NLP algorithms and whole pipelines and are able to interpret the results of such evaluations.

Information Retrieval. Students know basic retrieval models and information retrieval concepts and can explain them in the context of natural language processing.

Content

Lecture:
– Introduction into Natural Language Processing (NLP) and Information Retrieval (IR) concepts
– NLP pipeline and basic NLP methods/algorithms
– Evaluation principles and measurements
– Selected applications for NLP

Exercises:
In the exercises the content of the lecture is applied and deepened. For that the exercises contain theoretical as well as practical elements. In particular, the development of NLP algorithms and the design of NLP pipelines can be practically carried out.

Teaching

Lecture with (theoretical and pratical) exercises

Prerequisites for attending

150 h	5 CP	45 h	105 h

Course	Turnus	Group Size	Duration
Lecture: 2 SWS Seminar: 1 SWS	Each Winter Term	Limited to 25	1 Semester

Learning results & Competences
Neuroimaging
Students will be able to describe the basic principles of cognitive neuroimaging of the human brain as a basis for the subsequent application of Big Data and AI approaches. For all important imaging modalities, they can explain the relationship between neuronal activity and the measured signal. They will be able to evaluate strengths and weaknesses of the different modalities to address specific research questions. They will be able to explain the basics of experimental design and the statistical analysis of neuroimaging studies. In particular, they will be able to decide which approaches to the data analysis of brain imaging data are suitable for answering specific questions.
Precision Medicine
Students will have an understanding of how the collection and analysis of very large datasets (so-called "big data") can be used to study functional brain organization in the healthy brain and its disorders. They will understand how AI and data science can be used to draw conclusions about individual differences in the brain organization and identify biomarkers. Students will have an overview of clinical applications of the above methods for specific neurological and psychiatric disorders such as Parkinson's disease, Alzheimer's disease or schizophrenia.

Content
Lectures
Lectures start with an introduction to the main methods of structural and functional neuroimaging. Students learn the necessary steps for pre-processing and statistical analysis of the data. The usual methods of data analysis, such as case studies, group studies and correlation analyses, are discussed to give students an insight into what conclusions can be drawn from the various types of analysis and which methodological approaches are suitable for addressing which questions. In the second part of the lectures methodical approaches for the analysis of "Big Data" and for conclusions about individual differences in the structural and

functional brain organization are discussed. In particular, prediction and classification analyses are presented using brain imaging data. The lecture also deals with applications and results of these methods in the clinical context as well as with studies on the identification of individual biomarkers.
Seminars
It is the aim of the seminars to familiarize students with current research questions in the field of AI / Data Sciences in the Neuroscience and in Precision Medicine, and to encourage critical reflection of such issues. To this end, a series of current research topics in these areas will be discussed in the form of presentations prepared by the students themselves. The possible subject areas are varied, and the individual interests of the students can be taken into account. To give a comprehensive overview of the topic, the articles will be suggested by the lecturers.

Course Lecture: 2 SWS Exercises: 1 SWS	**Turnus** Irregular	**Group Size** Limited to 20	**Duration** 1 Semester

Learning results & Competences

The students will acquire knowledge on different numerical methods that are used to compute the solution of linear systems, least square problems, eigenvalue problems and the singular value decomposition. They will learn which algorithms are used in various situations.

Content

Lecture:

The class covers several powerful numerical linear algebra techniques that are used in various applications in data mining and pattern recognition. We first review basic linear algebra concepts and matrix decompositions, in particular the LU and the QR decomposition and use these techniques to solve linear systems and least square problems. Furthermore, we study different algorithms for computing eigenvalues and the singular value decomposition. Finally we will see how these concepts are used in different applications such as text mining, page ranking and face recognition. Throughout the course, the presented methods will be illustrated by test problems that are carried out in Matlab or Python.

Exercises:

The lectures are accompanied by exercise courses in which the students apply the different numerical methods that are covered in the lectures. Exercise problems are solved by the students independently, and are afterwards presented and discussed in the exercise courses.

Work Load	Credits	Contact Time	Self-study
150 h	5 CP	60 h	90 h

Course	Turnus	Group Size	Duration
Lecture: 2 SWS Exercises: 2 SWS	Every Second Summer Term	Limited to 20	1 Semester

Learning results & Competences
Concepts and Measurements of Intelligence. Students are able to explain and criticize different conceptions of intelligence in Psychology and Philosophy. Students are able to connect the different conceptions to specific ways of measuring intelligence and to evaluate the theoretical soundness of the measurements in relation to the different conceptions. Cognitive Models of Intelligence. Students are able to explain the theoretical foundations of cognitive modelling and cognitive architecture. They are able to name the most important cognitive faculties and to describe functional interdependencies. They are able to explain and criticize representationalist and anti-representationalist conceptions of the mind.
Goals and Limits of Cognitive Modelling. Students are able to describe the different possible goals of cognitive modelling within the cognitive sciences. They are able to identify the limits of different approaches in relation to the according epistemological goals.
The Ethics of Artificial Intelligence. Students know the most important ethical questions arising in the context of developing and implementing AI systems. They are able to discuss these questions against the background of different ethical theories.

Content
Lectures
The lecture starts with an historical overview of the different conceptions of intelligence in Psychology and Philosophy. The theoretical basis of these conceptions is introduced along with the proposed measurement of intelligence. The students learn to criticize the different approaches on the basis of the theoretical conceptions and to name their limits. Then, the relation between theories in Cognitive Science and cognitive modelling is introduced and discussed. A focus will be set on connectionist models in contrast to classical symbol- and rule-based models. The discussion of the different models will especially highlight the different cognitive faculties that favor one or the other model of explanation. With concrete examples, the interdependency between the explanatory goals and the virtues and limits of cognitive modelling are introduced. Finally, a systematic overview of the most important ethical

questions arising in the context of developing and implementing AI systems will be given. Based on prominent examples, different ethical theories are illustrated.
Exercise
The exercise will consist in the critical reading and discussion of key texts pertinent to the topics of and in parallel with the lecture.

Practical: Implementing Transformer Models

Responsible for the Module Prof. Dr. Milica Gašić			**Date** 08.10.2026
Lecturer(s) N.N.			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Practical: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 24	**Duration** 1 Semester

Learning results & Competences

By the end of the module, students will be able to:

- interpret the architectural nuances and computational aspects of Transformer models, including the attention mechanism and multi-head attention layers.
- adopt scientific research skills, such as setting up independent projects, implementing models based on academic literature, and producing scientifically sound, reproducible results.
- apply knowledge of optimal GPU utilisation, including the setup and management of parallel training environments and effective resource allocation for machine learning training.

Content

- Detailed study and implementation of the Transformer model, building an intuitive understanding of its unique architecture and the attention mechanism.
- Practical application of computational aspects of the Transformer model, including the scaling of dot products and shared parameter mechanisms, such as embedding vectors.
- Training a Transformer model tailored for machine translation, including the preparation and pre-processing of a translation dataset.
- Exploration of GPU utilisation, parallel training strategies and effective resource allocation for machine learning training.

Selected Topics in Randomized Algorithms

Responsible for the Module Dr. Anja Rey			**Date** 08.10.2026
Lecturer(s) Dr. Anja Rey			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Irregular	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After completion the students can
- describe technical terms and selected methods of randomization in algorithms
- match algorithms to different probabilistic techniques and apply them exemplarily
- analyze, evaluate and compare running times and computational complexity
- analyze accuracy with stochastic methods (e.g., concentration) and approximation guarantees
- design randomized algorithms according to probabilistic design methods.

Content

This course is a lecture on advanced algorithms and deals with randomization as a method of algorithm design and analysis. The goal is to obtain efficient algorithms via randomized decisions that run faster than their deterministic variants and at the same time provide precise results with high probability. Probabilistic methods provide analysis tools to prove guarantees for a successful computation. Selected topics include:
- variance-based concentration bounds (e.g., Chebyshev inequality, Chernoff-, Hoeffding-bounds)
- probabilistic method, Lovász Local Lemma
- algorithms based on Markov chains and random walks
- probabilistic polynomial time complexity
- property testing

Teaching

Lecture with theoretical exercises

Prerequisites for attending

Spectral Graph Theory and Graph Signal Processing

Responsible for the Module Dr. Peter Arndt			**Date** 14.10.2025
Lecturer(s) Dr. Peter Arndt			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 20	**Duration** Block Course, 2 Weeks

Learning results & Competences

In this module, students learn about different matrix representations of graphs and how the eigenvalues and eigenvectors of those matrices reveal combinatorial properties of the graph and subsequently help analyzing and structuring the underlying data. Additionally it is discussed how concepts from classical signal processing (like convolution and the Fourier transform) can be adapted to signals on graphs. After covering these basic concepts, the main focus is on applying them to real-world complex networks from various application areas.

Content

Classical spectral graph theory:
- Adjacency matrices
- The graph Laplacian
- Algebraic connectivity and the Fiedler vector
- The Cheeger constant and Cheeger's inequality
- Spectral clustering
- Graph coloring, the chromatic number and Wilf's theorem
- Centrality measures based on spectral information

Graph Signal processing:
- Signals on graphs
- Frequencies on graphs and the graph Fourier transform
- Interpreting graph frequencies
- Shifts and convolutions on graphs
- Total variation on graphs
- Diffusion processes on graphs
- Learning graphs from data

Applications:
- Community detection in complex networks

• Spreading of infectious diseases
• Efficient exploration of large networks
• Finding consensus in multi-agent systems via network dynamics
• Fake image detection with Forensic Similarity Graphs

Teaching
Lecture with (theoretical and practical) exercises

Further Information

Spoken Dialogue Systems

Responsible for the Module Prof. Dr. Milica Gašić			**Date** 19.03.2025
Lecturer(s) Prof. Dr. Milica Gašić, Dr. Nurul Lubis			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Irregular	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences

On completion of this module, students should understand:
The purpose and operation of the main components of a spoken dialogue system
How the framework of partially observable Markov decision processes can be used to model a spoken dialogue system
How classification, regression, sequence-to-sequence models and reinforcement learning can be used to implement a spoken dialogue system. The various options for optimizing and adapting a statistical spoken dialogue system, both off-line and on-line, and how deep learning can be utilised to achieve state of the art results in dialogue modelling.

Content

Introduction: Architecture of a spoken dialogue system, dialogue acts, turn management issues
Semantic decoding: representing and decoding meaning from user inputs, semantic decoding as a classification task, semantic decoding as a sequence-to-sequence learning task
Dialogue state tracking: tracking beliefs over multiple turns, classical generative and discriminative approaches, recent deep learning approaches, integration of decoding and tracking.
Dialogue Management: modelling via Markov Decision Processes, reinforcement learning, gradient methods, lifelong and meta learning
Response Generation: template methods, generative models, recent neural network approaches
Speech interface: automatic speech recognition and speech synthesis
Advance topics: End-to-end dialogue systems, large language models (LLMs) and reinforcement learning with human feedback (RLHF), autonomous agents, and affective dialogue systems

Practical Work:
Students will be provided with a set of Python tools which will enable them to configure and test a simple spoken dialogue system. They will be asked to implement parts of dialogue system modules related to training, design, and evaluation. Students will also implement a

reinforcement learning algorithm and optimize the dialogue manager in interaction with a simulated user. This will give them an opportunity to explore a practical example of reinforcement learning.

Teaching

Course Lecture: 2 SWS Exercises: 1 SWS	**Turnus** –	**Group Size** Limited to 20	**Duration** 1 Semester

Learning results & Competences

The students will acquire knowledge on different types of statistical learning methods, with an emphasis on dimensionality reduction, clustering and classification. They will be able to apply those methods independently to different types of data, to present their solution and to discuss the results critically. The students gain profound knowledge in using the statistical software environment and language R for the data analyses. They gain methods of systematic and efficient knowledge acquisition.

Content

Lecture

The lecture covers some of the most important statistical learning methods, with an emphasis on dimensionality reduction, clustering and classification, as well as on the application to different types of data. The lecture serves as a complement to the module „Statistical Data Analysis“, but may be attended without any knowledge from that module.

The lecture starts by discussing the most common approaches to dimensionality reduction, in particular principal component analysis and factor analysis based on latent variable models. The second part covers clustering methods, in particular hierarchical clustering algorithms based on similarity and dissimilarity measures and k-means clustering. The third part covers basic supervised learning methods for classification: classical approaches like linear and quadratic discriminant analysis and logistic regression, K-nearest Neighbors, classification trees (CART algorithm, weakest link pruning), ensemble methods like bagging and random forests, support vector machines, as well as model evaluation based on cross-validation.

Throughout the course, the presented methods will be illustrated by exemplarily applications carried out within the statistical software environment and language R, the nowadays most popular software for advanced statistical analysis. The knowledge on R is successively extended during the semester (in both the lectures and the exercise courses).

Exercise course

The lectures are accompanied by exercise courses in which exercises concerned with the practical application of the statistical learning methods to data sets from different fields of

application are discussed. These data analysis problems are solved by the students independently, and are afterwards presented and discussed in the exercise courses.

Teaching
Lecture with exercise course.

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Passed exam in „Mathematical and Statistical Foundations in Data Science“. It is further recommended to have taken a course on stochastics previous to this course.

Examination
Typically, a written examination about the content of this course.

Prerequisites for receiving credit points
Passing the exam.
Regular and active attendance of the practical work.

Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** Each Term	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After completing the course, students are able to
- distinguish and recognise key biological features that justify the use of the models studied,
- explain modelling approaches based on the underlying biology,
- develop and implement stochastic algorithms using the programming language C++,
- simulate the dynamics of the systems studied and critically evaluate the quality of their results,
- reproduce all analytical calculations executed in the course,
- explain physico-chemical parameters that influence the dynamics of the processes studied.

Content

- Cell birth-and-death, moment-generating functions.
- Diffusion models and Brownian dynamics, comparison of deterministic versus stochastic approaches.
- Protein production, the Totally Asymmetric Simple Exclusion Process, its analytical solution in mean field.
- Cytoskeletal transport, directed transport properties of three dimensional structures.
- Polysaccharide synthesis, complex enzymatic processes.

The course describes the stochastic modelling (analytical and numerical) of the biological systems from cell biology above listed. Key algorithms used throughout the module are Monte Carlo and Gillespie, implemented in C. The module is highly interdisciplinary and includes knowledge and methods from Mathematics, Biology, Physics, and Chemistry, with a strong focus on algorithms and programming in the tutorials. The methods and tools learnt during this course also apply to other fields than Biology. Specifically, they are used in theoretical Physics of both dilute and condensed systems, and Engineering. The programming language C is widely spread in these fields since it is well suited for computer intensive numerical methods.

Teaching

Lecture with theoretical and practical exercises

Prerequisites for attending
Examination Written exam, usually 90 minutes
Prerequisites for receiving credit points 50 percent of total points in the exercises Passing the examination
Study Program M.Sc. Artificial Intelligence and Data Science
Module accessible for other Study Programs M.Sc. Artificial Intelligence and Data Science
Weight in overall rating The mark given will contribute to the final grade in proper relation to its credit points.

Lecturer(s)			
Dr. Stefan Richter			
Language:			**Modus**
English			Elective Course
Work Load	**Credits**	**Contact Time**	**Self-study**
150 h	5 CP	45 h	105 h
Course	**Turnus**	**Group Size**	**Duration**
Lecture: 2 SWS Exercises: 1 SWS	Irregular	–	1 Semester

Learning results & Competences

Learning results:

understand the fundamental concepts of time series data, including trend, seasonality, and stationarity;

apply classical statistical models such as AR, MA, ARMA, and (G)ARCH processes to analyze and forecast time series;

conduct unit root and cointegration tests to identify integration and long-run relationships between variables;

formulate and estimate state-space models using the Kalman filter and smoother, as well as particle filters based on Bayesian/MCMC formulations

implement basic time series forecasting with neural network architectures, including RNN and LSTM models;

combine theoretical understanding with practical skills using statistical software for time series modeling and forecasting.

Competences:

Analytical and quantitative reasoning in dynamic data analysis

Critical assessment of model assumptions and performance

Ability to independently conduct empirical time series research

Content

1 Introduction to Classical Time Series Analysis

Time series characteristics, trends, and seasonal effects

Stationarity and autocorrelation analysis

Spectral analysis and short-term forecasting

2 Stationary Time Series Models

AR, MA, and ARMA models: theory, estimation, and diagnostics

Conditional heteroskedasticity models: ARCH and GARCH

3 Integrated and Co-integrated Processes

Unit root testing and integration in AR(p) models

Cointegration and long-run equilibrium relationships
4 State-Space Models
Kalman filter and smoother
Parameter estimation and extensions (EKF, particle filters)
Bayesian methods, MCMC, and Particle MCMC
EM algorithm and online estimation
5 Time Series Forecasting with Neural Networks
Neural networks as nonlinear function approximators
Recurrent and LSTM networks for sequential data forecasting

Work Load	**Credits**	**Contact Time**	**Self-study**
150 h	5 CP	60 h	90 h
Course	**Turnus**	**Group Size**	**Duration**
Lecture: 2 SWS Exercises: 2 SWS	Irregular	Limited to 40	1 Semester

Learning results & Competences

The students know the general idea of algebraic topology and the notions of metric spaces, simplicial complexes, homotopy, and (co)homology.
They know how a point cloud gives rise to a filtered simplicial complex via the Čech and Vietoris–Rips constructions, and they understand filtrations conceptually.
They know the concept of persistent homology of a filtered simplicial complex, including the decomposition of persistence modules at a high level, and the role of barcodes and persistence diagrams.
They know TDA-motivated methods for exploratory data analysis, particularly UMAP and the Mapper algorithm.
They know software tools to perform topological data analysis in practice (e.g., Ripser, GUDHI, giotto-tda) and how to use topological descriptors in deep learning pipelines, including vectorization methods like persistence landscapes and persistence images, and distances such as the bottleneck and Wasserstein distances.
They know topology-aware deep learning strategies (using topological features as inputs, persistence layers, and topological loss/regularization).
They know application patterns in graph learning and natural language processing (e.g., topology of embedding spaces, connected components, cycles, and higher-order structures).
They can implement basic pipelines to compute, vectorize, and integrate persistence-based features; select appropriate complexes and parameters; and critically analyze the topology of learned representations.

Content

Part I – Mathematical foundations: Basic notions in topology; Simplicial complexes; Homotopy; Simplicial homology; Čech complex & Vietoris–Rips complex; Filtrations.
Part II – Core TDA techniques & tools: Barcodes & Persistence diagrams; Bottleneck/Wasserstein distances and Stability; Practical TDA software workflows; Vectorization of persistence; Mapper algorithm; UMAP.
Part III – Topological deep learning: Using topological descriptors in deep learning pipelines;

Differentiable/topology-aware components; Topological loss/regularization.
Part IV – Applications in key domains: Graph learning (GNNs); Natural language processing.

Learning results & Competences

After successfully finishing the course, the student

* can understand and explain the theoretical foundations of uncertainty quantification in machine learning

*can implement and apply algorithms of uncertainty quantification in machine learning

Content

This lecture elaborates on both theoretical and practical aspects of machine learning and deep learning, with a focus on uncertainty quantification (UQ). We will cover a short recap on basics of probability theory, introduce linear models, and then have an introduction to statistical learning theory for binary classification. Afterwards, we will get to know the basics of UQ for linear models, move on with Bayesian learning and parameter UQ. We will then introduce deep neural networks, see some of their drawbacks and perform UQ for them. The lecture will be presented by means of slides and python jupyter notebooks. The exercises will cover proofs, arithmetic problems and programming tasks.

Course	**Turnus**	**Group Size**	**Duration**
Lecture: 2 SWS Exercises: 2 SWS	Each Winter Term	Limited to 30	1 Semester

Learning results & Competences

After completing the course, students are able to
define, discuss, and apply the concepts, methods, and tools of analyzing and managing the experiences users perceive in interaction with new digital technologies of startups/established companies,
measure and analyze user experiences of novel technologies and infer recommendations for technology and policy design and development,
assess and reflect the social and ethical implications of designing, evaluating, and implementing digital technologies,
present user research results towards peers, and
develop skills in collaborative interaction with peers.

Content

Students explore the user perspective on interacting with digital technologies, thereby becoming more aware of users' needs during product development. Designing and maintaining great user experience (UX) is the best way for both startups and established companies to build trust, retention, and loyalty of staff and customers alike.
The lecture
teaches the key concepts, methods, and approaches that help design, measure, and manage total UX across organizations and drive value propositions of digital business models.
discusses established and new methods of UX research for (further) developing digital technologies.
introduces frameworks to build and lead teams of UX researchers, designers, engineers, product managers.
employs case studies to transfer and discuss the application of UX design, research, and management in practice.
In the practice sessions, (groups of) students
practically apply UX research methods and tools (e.g., user interviews, A/B testing, or emotion detection) to investigate users' experiences in interaction with state-of-the-art digital

technology prototypes and to deduce implications for product and organizational strategy, development, and design.
present the results towards peers and experts from research and industry.

Approximation Algorithms for Clustering Problems (deprecated)

Responsible for the Module Prof. Dr. Melanie Schmidt			**Date** 15.10.2025
Lecturer(s) Prof. Dr. Melanie Schmidt			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** –	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After completing the course, students are able to
- model discussed and new clustering problems as linear programs,
- describe advanced analysis techniques for discussed clustering problems,
- explain discussed algorithmic ideas for clustering problems, and
- analyze the approximation guarantee of discussed and slightly varified clustering procedures.

Content

This course is a lecture on advanced algorithms and deals with clustering algorithms. The focus lies on approximation algorithms. In particular, we discuss the following topics:
- LP-based techniques
- local search
- approximation algorithms for the k-median problem and for the k-means problem
- clustering in the Euclidean space
- dimensionality reduction and data stream algorithms for clustering problems

Teaching

Lecture with theoretical and practical exercises

Prerequisites for attending

Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: It is helpful to know the contents of the modules Approximation Algorithms and Combinatorial Algorithms for Clustering Problems from the M.Sc. Computer Science

Examination

Learning results & Competences

After successfully finishing the course, the student

* can understand and can explain the theoretical foundations of causal inference
* can implement and apply algorithms of causal inference

Content

This module teaches foundational knowledge about:

* Directed acyclic graphs, causal graphs
* Conditional independence
* PC algorithm
* Structural equation models
* Additive noise models
* Interventions
* Counterfactuals
* Markov equivalence
* Faithfulness
* Distinguishing cause and effect

Clinical Decision Support Systems (CDSS) (deprecated)

Responsible for the Module N.N. (previously Prof. Dr. Dominik Heider)			**Date** 18.01.2024
Lecturer(s) Dr. Oluwafemi A. Sarumi			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** –	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

After completing this course, students should be able to:

- describe the process of DSS including their principles, functionalities, and applications in healthcare settings.
- integrate DSS seamlessly with EHR systems, fostering interoperability and efficient data utilization.
- apply CDSS in real-world scenarios, addressing practical design and implementation challenges.
- understanding the regulatory landscape and compliance requirements for decision support systems

Content

In this course, students will learn the theoretical foundations of Decision Support Systems (DSS) and explore their integration with electronic health record (EHR) systems. The curriculum covers essential concepts such as decision rule modeling, representation, design, and implementation. Also, students will gain insights into the technology of clinical decision support systems and its broader applications. Additionally, the course will delve into ethical considerations, and strategies for evaluating Clinical Decision Support Systems (CDSS).

Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** –	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

Application of W3C Standards (RDF, SPARQL) for using and extracting Knowledge Graphs, Linked Data and structured Data in the Web

Basic understanding of Information- und Knowlege Extraction Methods

Generation of formal Knowledge Represention and Knowledge Databases using Description Logics

Understanding and applying structured Web Markup (RDFa, Microdata, schema.org)

Content

Understanding and interpreting heterogeneous data, in particular in distributed settings such as the Web, remains a challenging task. State-of-the-art Web applications such as Web search engines rely on a combination of approaches for making sense of data, involving both explicit knowledge, for instance, through knowledge graphs such as Wikidata or the Google knowledge graph and semi-structured Web markup, as well as statistical and machine-learning based approaches.

This course provides an introduction to data and knowledge engineering methods and principles, with a particular focus on the Web. This includes methods related to knowledge graphs and formal data & knowledge representation (RDF, OWL, Description Logics), data integration and linking, information extraction, Web data sharing practices (Linked Data, Semantic Web and affiliated W3C standards such as RDF, RDFa, Microdata), as well as emerging approaches in the context of distributional semantics, such as word and entity embeddings. Attention will also be paid to applications of taught techniques to facilitate data sharing and reuse on the Web.

Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** –	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

Students understand the principles of mathematic modeling of cellular reaction networks. They can give various examples on how physical constraints on cellular growth and replication can be modeled.

Students are able to build and analyze self-replicator cellular models using the GNU R or Python programming languages.

Basic concepts behind linear and nonlinear numerical optimization are known and the course participants are able to highlight the specific differences and computational challenges.

Content

- Introduction to the mathematical modeling and analysis of cellular reaction networks as a resource allocation problem
- The main physical constraints on cellular growth and replication
- Growth modeling: self-replicator models and nonlinear optimization
- The Singular Value Decomposition (SVD) of the normalized stoichiometric matrix: Fundamental Modes
- Growth Economy and Control Analysis: the marginal value of reactions and specific costs and benefits
- Growth Balance Analysis: the analytical conditions for optimal cellular growth
- Principles of nonlinear numerical optimization

With the help of selected examples, the course describes the modeling and analysis of cellular reaction networks, combining multidisciplinary methods from Mathematics, Biology, Physics, Chemistry, and Computer Science.

Teaching

Lecture with theoretical and practical exercises

Prerequisites for attending

Students should be comfortable with the fundamentals of multivariate Calculus and Linear Algebra, and should be proficient with a programming language. The language of the course is

English.

Master's Seminar: Limits of Computation (deprecated)

Responsible for the Module Prof. Dr. Melanie Schmidt			**Date** 15.10.2025
Lecturer(s) Abhiruk Lahiri (PhD)			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 30 h	**Self-study** 120 h
Course Seminar: 2 SWS	**Turnus** –	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

Upon completion of the course, students will be expected to:
know about different classes of computationally hard problems
analyse the running time of algorithms through rigorous argument
acquire a broad overview of existing literature on hard problems
successfully perform reduction techniques to map a problem of interest onto another problem of known hardness
demonstrate the ability to comprehend and effectively communicate the contents of assigned topics, both in written and oral formats

Content

Understanding the limits of computation is paramount in comprehending the provable accuracy of algorithms. Impossibility results and hypotheses delineate the boundaries within which algorithmic improvements can be anticipated. This understanding is increasingly crucial in our current era, where algorithms assume decision-making responsibilities in intricate processes on our behalf. The objective of this module is to familiarise students with significant research areas. Through this module, students will delve into topics such as NP-hardness, approximation hardness, Exponential Time Hypothesis and hardness within polynomial time algorithms.

Teaching

Seminar sessions every week

Prerequisites for attending

Formal: Admission to master studies in 'Artificial Intelligence and Data Science'
Contentual: Advanced Programming and Algorithms

Examination

Assessment of the write-up and the presentation

Prerequisites for receiving credit points

Preparation of a report on a topic within the scope of the module;

giving twenty minutes presentation on the chosen topic
peer review two other reports and provide feedback;
taking active participation during other presentations.

Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** –	**Group Size** Limited to 40	**Duration** 1 Semester

Learning results & Competences
The students will obtain a theoretical understanding of Probabilistic Machine Learning tools, that is Probabilistic Graphical Models and various generative models. The students will obtain the capabilities to implement and apply the covered techniques. They will understand the probabilistic foundations of the field. They will understand their numerical implementation and their application to problems in machine learning.

Content
Probabilistic Graphical Models, Directed & Undirected Graphical Models, Exact, Approximate and Variational Inference, Sampling, Learning Probabilistic Graphical Models,
Generative Models, including Variational Autoencoders, autoregressive models, normalizing flows, energy-based models and diffusion models.
Probabilistic Basics needed for Probabilistic Machine Learning, ELBO, divergence measures

Relational Databases and Data Analysis (deprecated)

Responsible for the Module Prof. Dr. Stefan Conrad			**Date** 15.10.2025
Lecturer(s) Prof. Dr. Stefan Conrad			
Language: English			**Modus** Elective Course
Work Load 150 h	**Credits** 5 CP	**Contact Time** 60 h	**Self-study** 90 h
Course Lecture: 2 SWS Exercises: 2 SWS	**Turnus** –	**Group Size** –	**Duration** 1 Semester

Learning results & Competences

Relational Databases.

Students understand the relational model for databases together with its foundations (e.g. relational algebra). They are able to design relational databases and to express simple and complex database queries using SQL.

Data warehouses.

Students know the basic architecture and central concepts of data warehouses and can explain them. They can design relational data warehouses using multi-dimensional modelling.

OLAP and complex database queries.

Students are able to understand, analysis and formulate complex OLAP and database queries using the SQL query language and its OLAP extension.

Content

Lecture:
– Introduction into the relational database model and relational data warehouses;
– Design of relational databases
– Multi-dimensional modelling for (relational) data warehouses
– SQL
– OLAP
– Complex OLAP queries in SQL for data analysis

Exercises:
In the exercises the content of the lecture is applied and deepened. For that the exercises contain thoeretical as well as practical elements. In particular, the development of complex OLAP and database queries using the language SQL can practically be carried out using a database system provided to the students.

Teaching
Lecture with (theoretical and practical) exercises

Lecture: 2 SWS Exercises: 1 SWS	–	Limited to 20	1 Semester

Learning results & Competences

The students will be able to perform statistical analyses of different types of data and to use the statistical software environment and language R for these data analyses. The students will acquire knowledge on different types of statistical methods such as testing procedures, analysis of variance, and regression methods, on how to use these methods for a statistical data analysis, and on good practice in planning a study, in preparing data sets for a statistical analysis, as well as in presenting the results of a statistical analysis using, e.g., graphical data presentations. They will be able to decide which of the statistical methods to use in which situation and to apply these procedures to the data.

Content

Lecture

The lecture covers a wide range of statistical methods focusing on the practical aspects of these methods and their application to different types of data. Since the statistical software environment and language R is the most popular, advanced software for statistical analysis, R is mainly used in the lecture to exemplify the application of the statistical procedures. Therefore, the lecture starts with a basic, practical introduction to R. This knowledge on R is successively extended during the semester (in both the lectures and the exercise courses). It is discussed how graphics and descriptive statistics can be generated in R and should be generated in general to present and summarizing the data and the results of a data analysis in a best practice way. Moreover, good practice in preparing a data set for a statistical data analysis in, e.g., R is discussed. Prior to the actual data analysis an important step is the preprocessing of the data including checking the data for plausibility or errors, determining whether input variables should be transformed and how they could be transformed, as well as handling missing values in the data. Therefore, these issues will be discussed in the lecture in a practical way.
Afterwards, the general principle of statistical testing and multiple statistical testing as well as testing procedures for the most important testing situations are taught. It is discussed how to apply these tests to data, how to check the assumptions of these tests, and how to select the most appropriate test for a particular testing situations. The rest of the course is dedicated to

one- and multi-way analysis of variance as wells as different regression methods including linear regression, generalized linear models (especially, logistic regression), regularized regression (e.g., ridge regression and Lasso), (generalized) linear mixed models, Cox proportional hazard models, and nonparametric regression models (e.g., kernel smoothing, smoothing splines, or neural nets from a regression perspective). Besides the Cox regression, survival analysis is also considered in general. Again, in the discussion of the analysis of variance and the regression methods, emphasis will be placed on practical aspects of the application of these methods to data, considering different types of data sets.
Exercise course
The lectures are accompanied by exercise courses in which exercises concerned with the practical application of the statistical procedures taught in the lectures to data sets from different fields of application are discussed. These data analysis problems are solved by the students independently, and afterwards, presented and discussed in the exercise courses.

Teaching
Lecture with exercise course.

Prerequisites for attending
Formal: Admission to master studies in „Artificial Intelligence and Data Science“.
Contentual: Passed exam in „Mathematical and Statistical Foundations in Data Science“. It is recommended to have taken a course on stochastics previous to this course.

Examination
Typically, a written examination about the content of this course.

Prerequisites for receiving credit points
Passing the exam.
Regular and active attendance of the practicals.

Study Program
M.Sc. Artificial Intelligence and Data Science

Module accessible for other Study Programs
B.Sc. Mathematics

Weight in overall rating
The mark given will contribute to the final grade in proper relation to its credit points.
